

# Hierarchical Bayesian Inference + Probabilistic Graphical Models

Daniela Huppenkothen

*DIRAC Institute, University of Washington*

# Nature is complex!

—

... so is our data (collection)!

—

All models are **wrong**,  
but some are **useful**.

— George Box

 &\quad \times p(\text{🏠} | \text{🌡️}) p(\text{🌡️}) p(\text{🕒})
 \end{aligned}$$

Example:

Credit:  
D. Hogg

# Exercise

Write down a graphical model for the toy  
cosmological parameter inference exercise from the  
Bayesian statistics session

# Alternative Exercise

Write down a graphical model for the probability of catching a cold. What different factors does that probability depend on? What variables should you take into account? What do they in turn depend on?

# Bayesian Hierarchical Models

---

We have shown that we can write down arbitrarily complex probability distributions ...

$$p(\text{😎}) p(\text{☀️}, \text{🌴}, \text{🕒}, \text{🏠}, \text{🌡️} \mid \text{😎}) = \prod_{i=1}^7 p(\text{😎} \mid \text{☀️}, \text{🏠}) p(\text{☀️} \mid \text{🌴}, \text{🕒}) \\ \times p(\text{🏠} \mid \text{🌡️}) p(\text{🌡️}) p(\text{🕒})$$

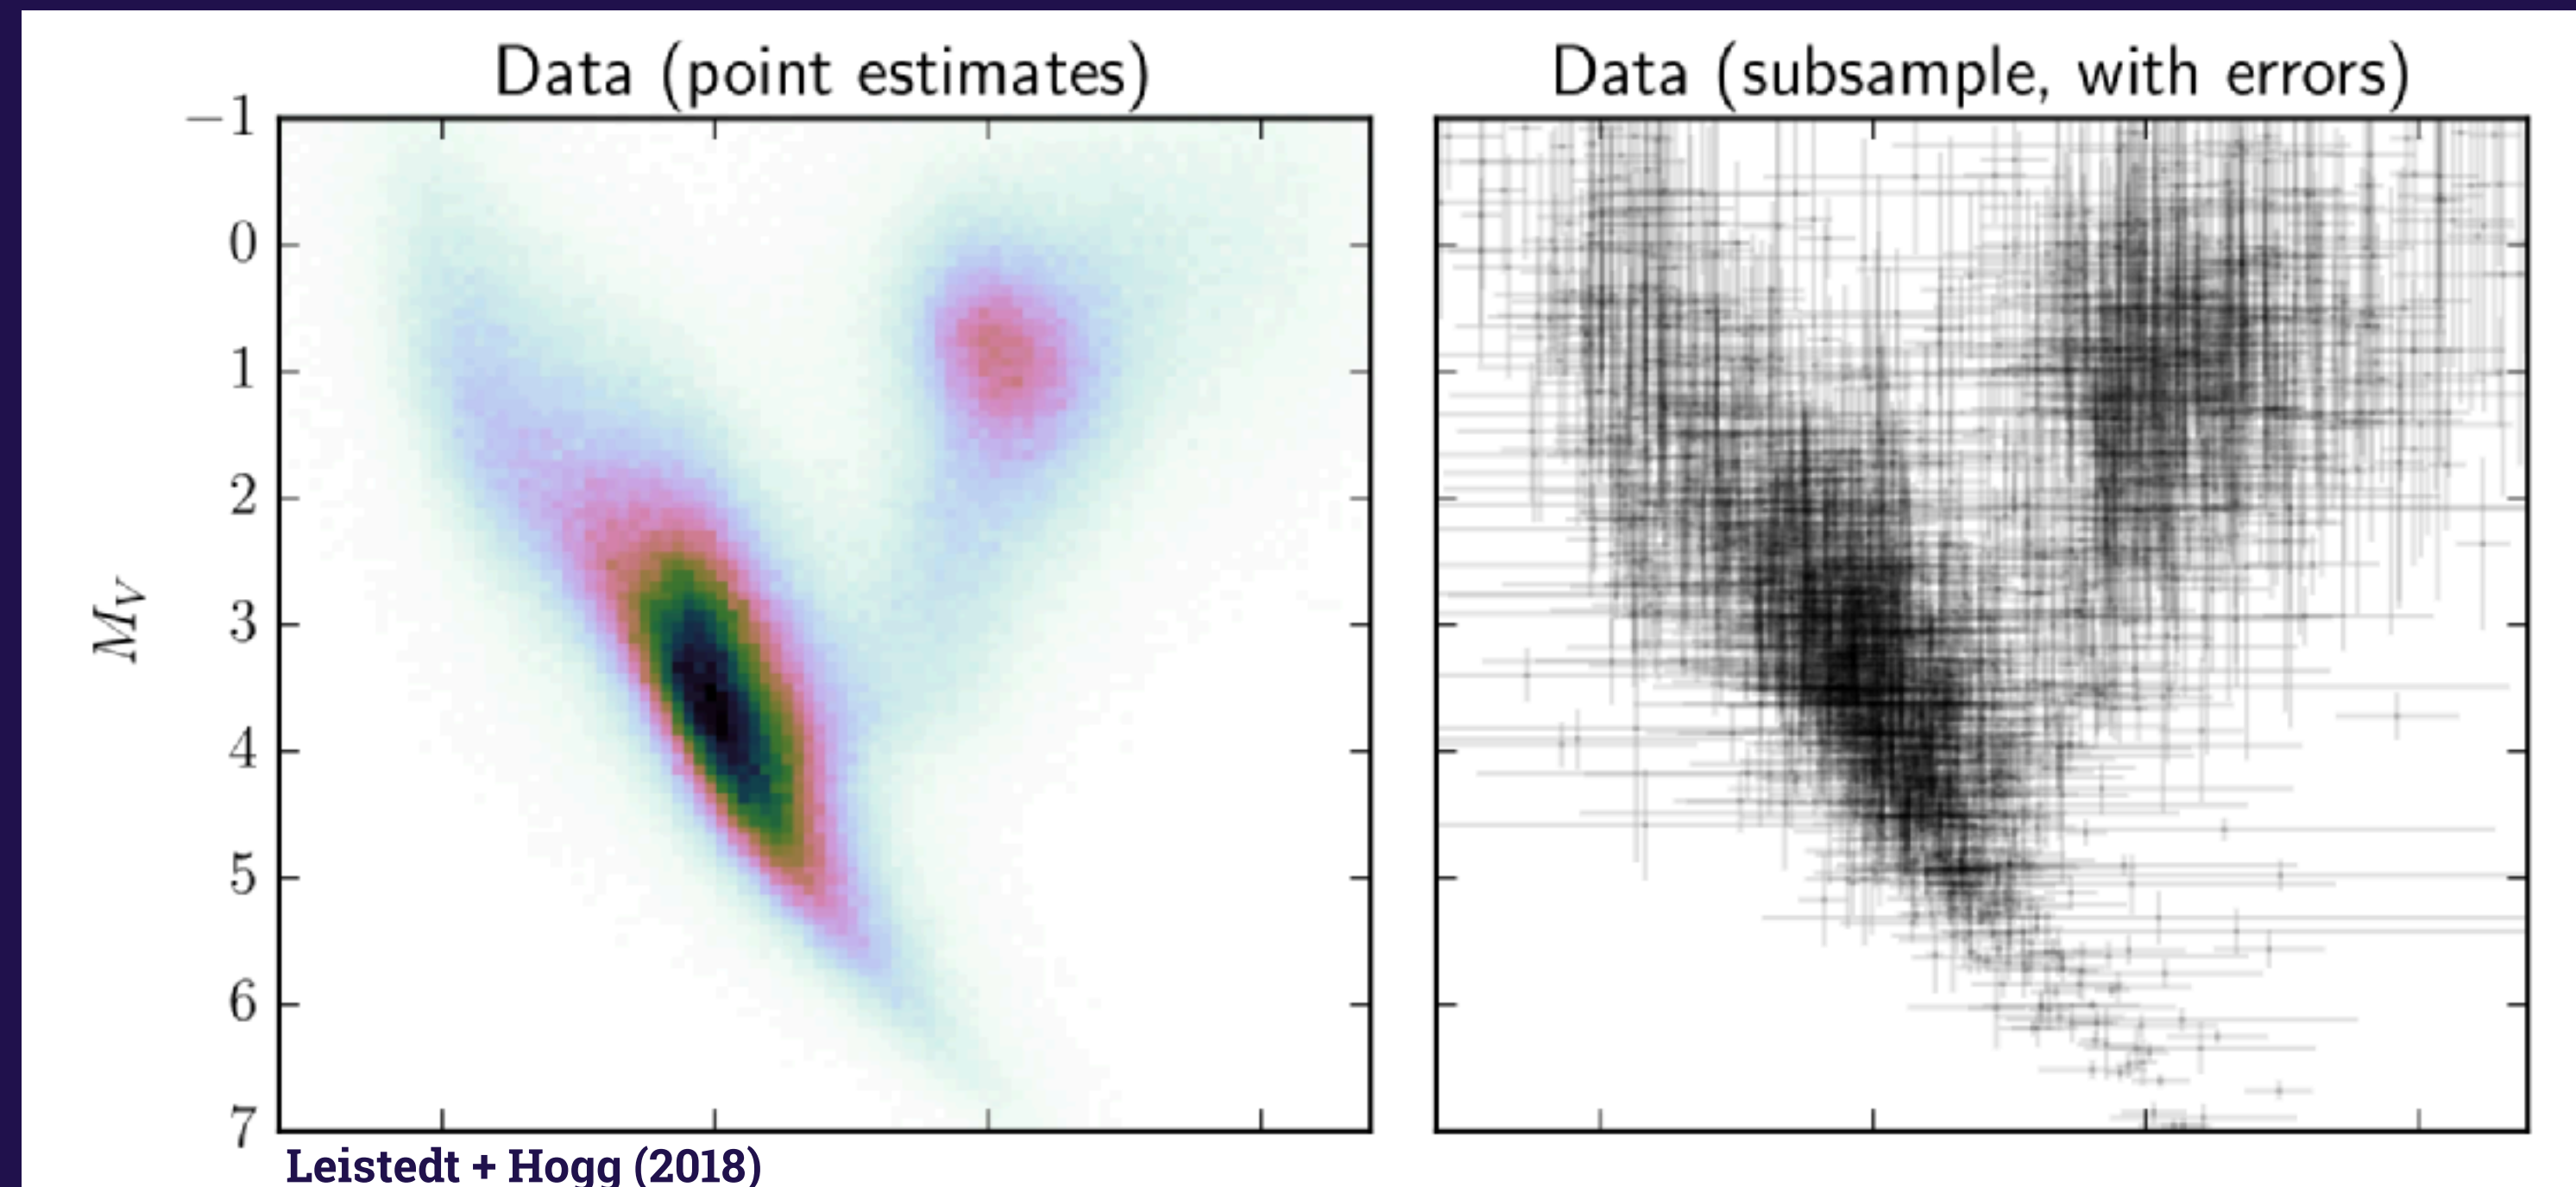

We have shown that we can write down arbitrarily complex probability distributions ...

$$p(\text{😎}) p(\text{☀️}, \text{🌴}, \text{🕒}, \text{🏠}, \text{🌡️} | \text{😎}) = \prod_{i=1}^7 p(\text{😎} | \text{☀️}, \text{🏠}) p(\text{☀️} | \text{🌴}, \text{🕒}) \\ \times p(\text{🏠} | \text{🌡️}) p(\text{🌡️}) p(\text{🕒})$$

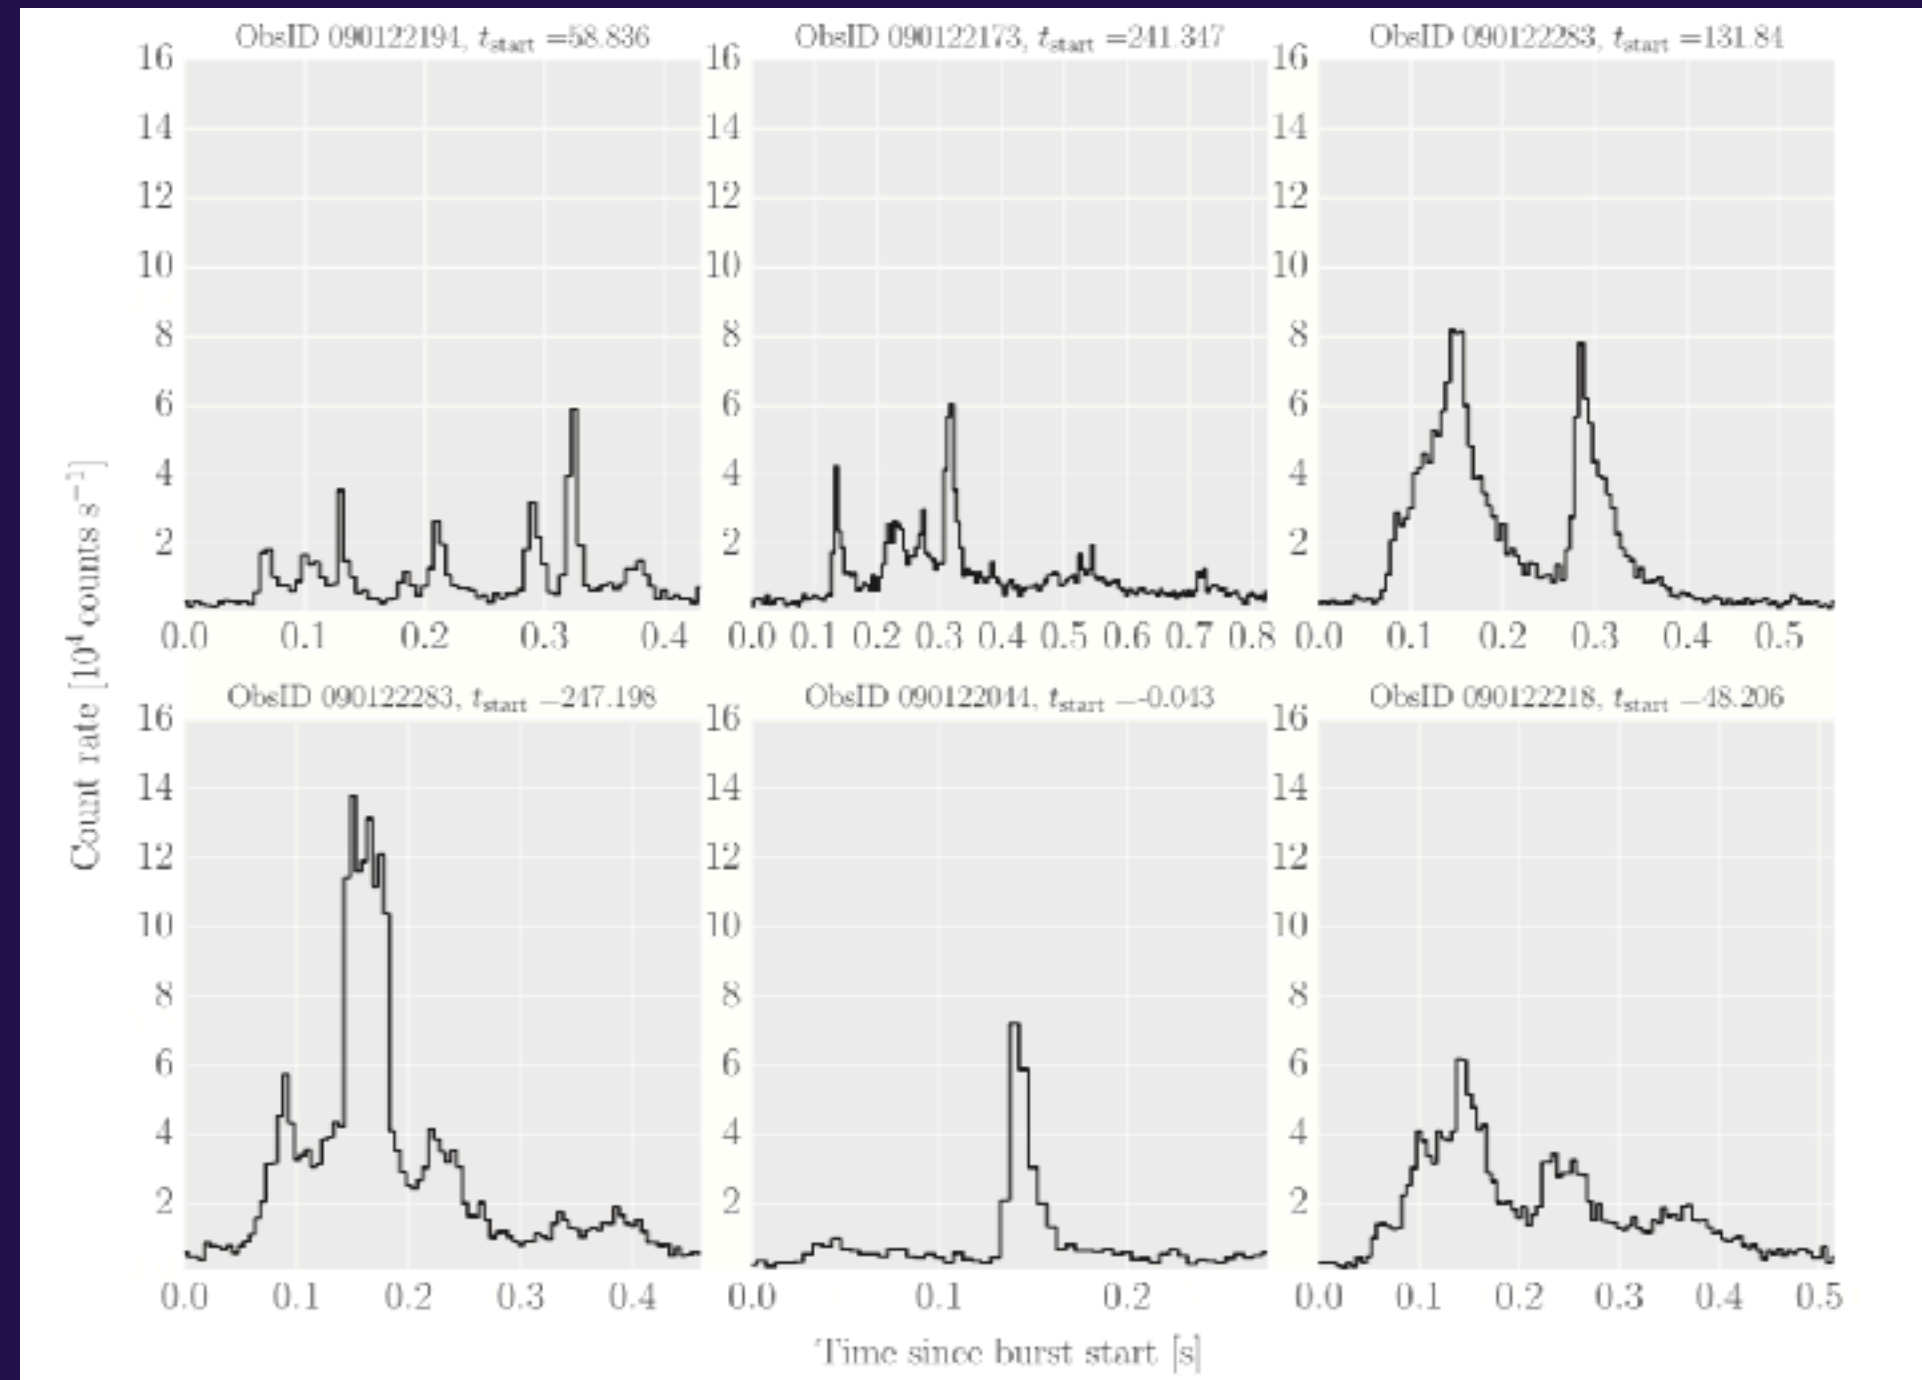

... now what?

# Might have many objects ...

---

# ... or many observations per object

# ... or several types of uncertainties

# A motivating example ...

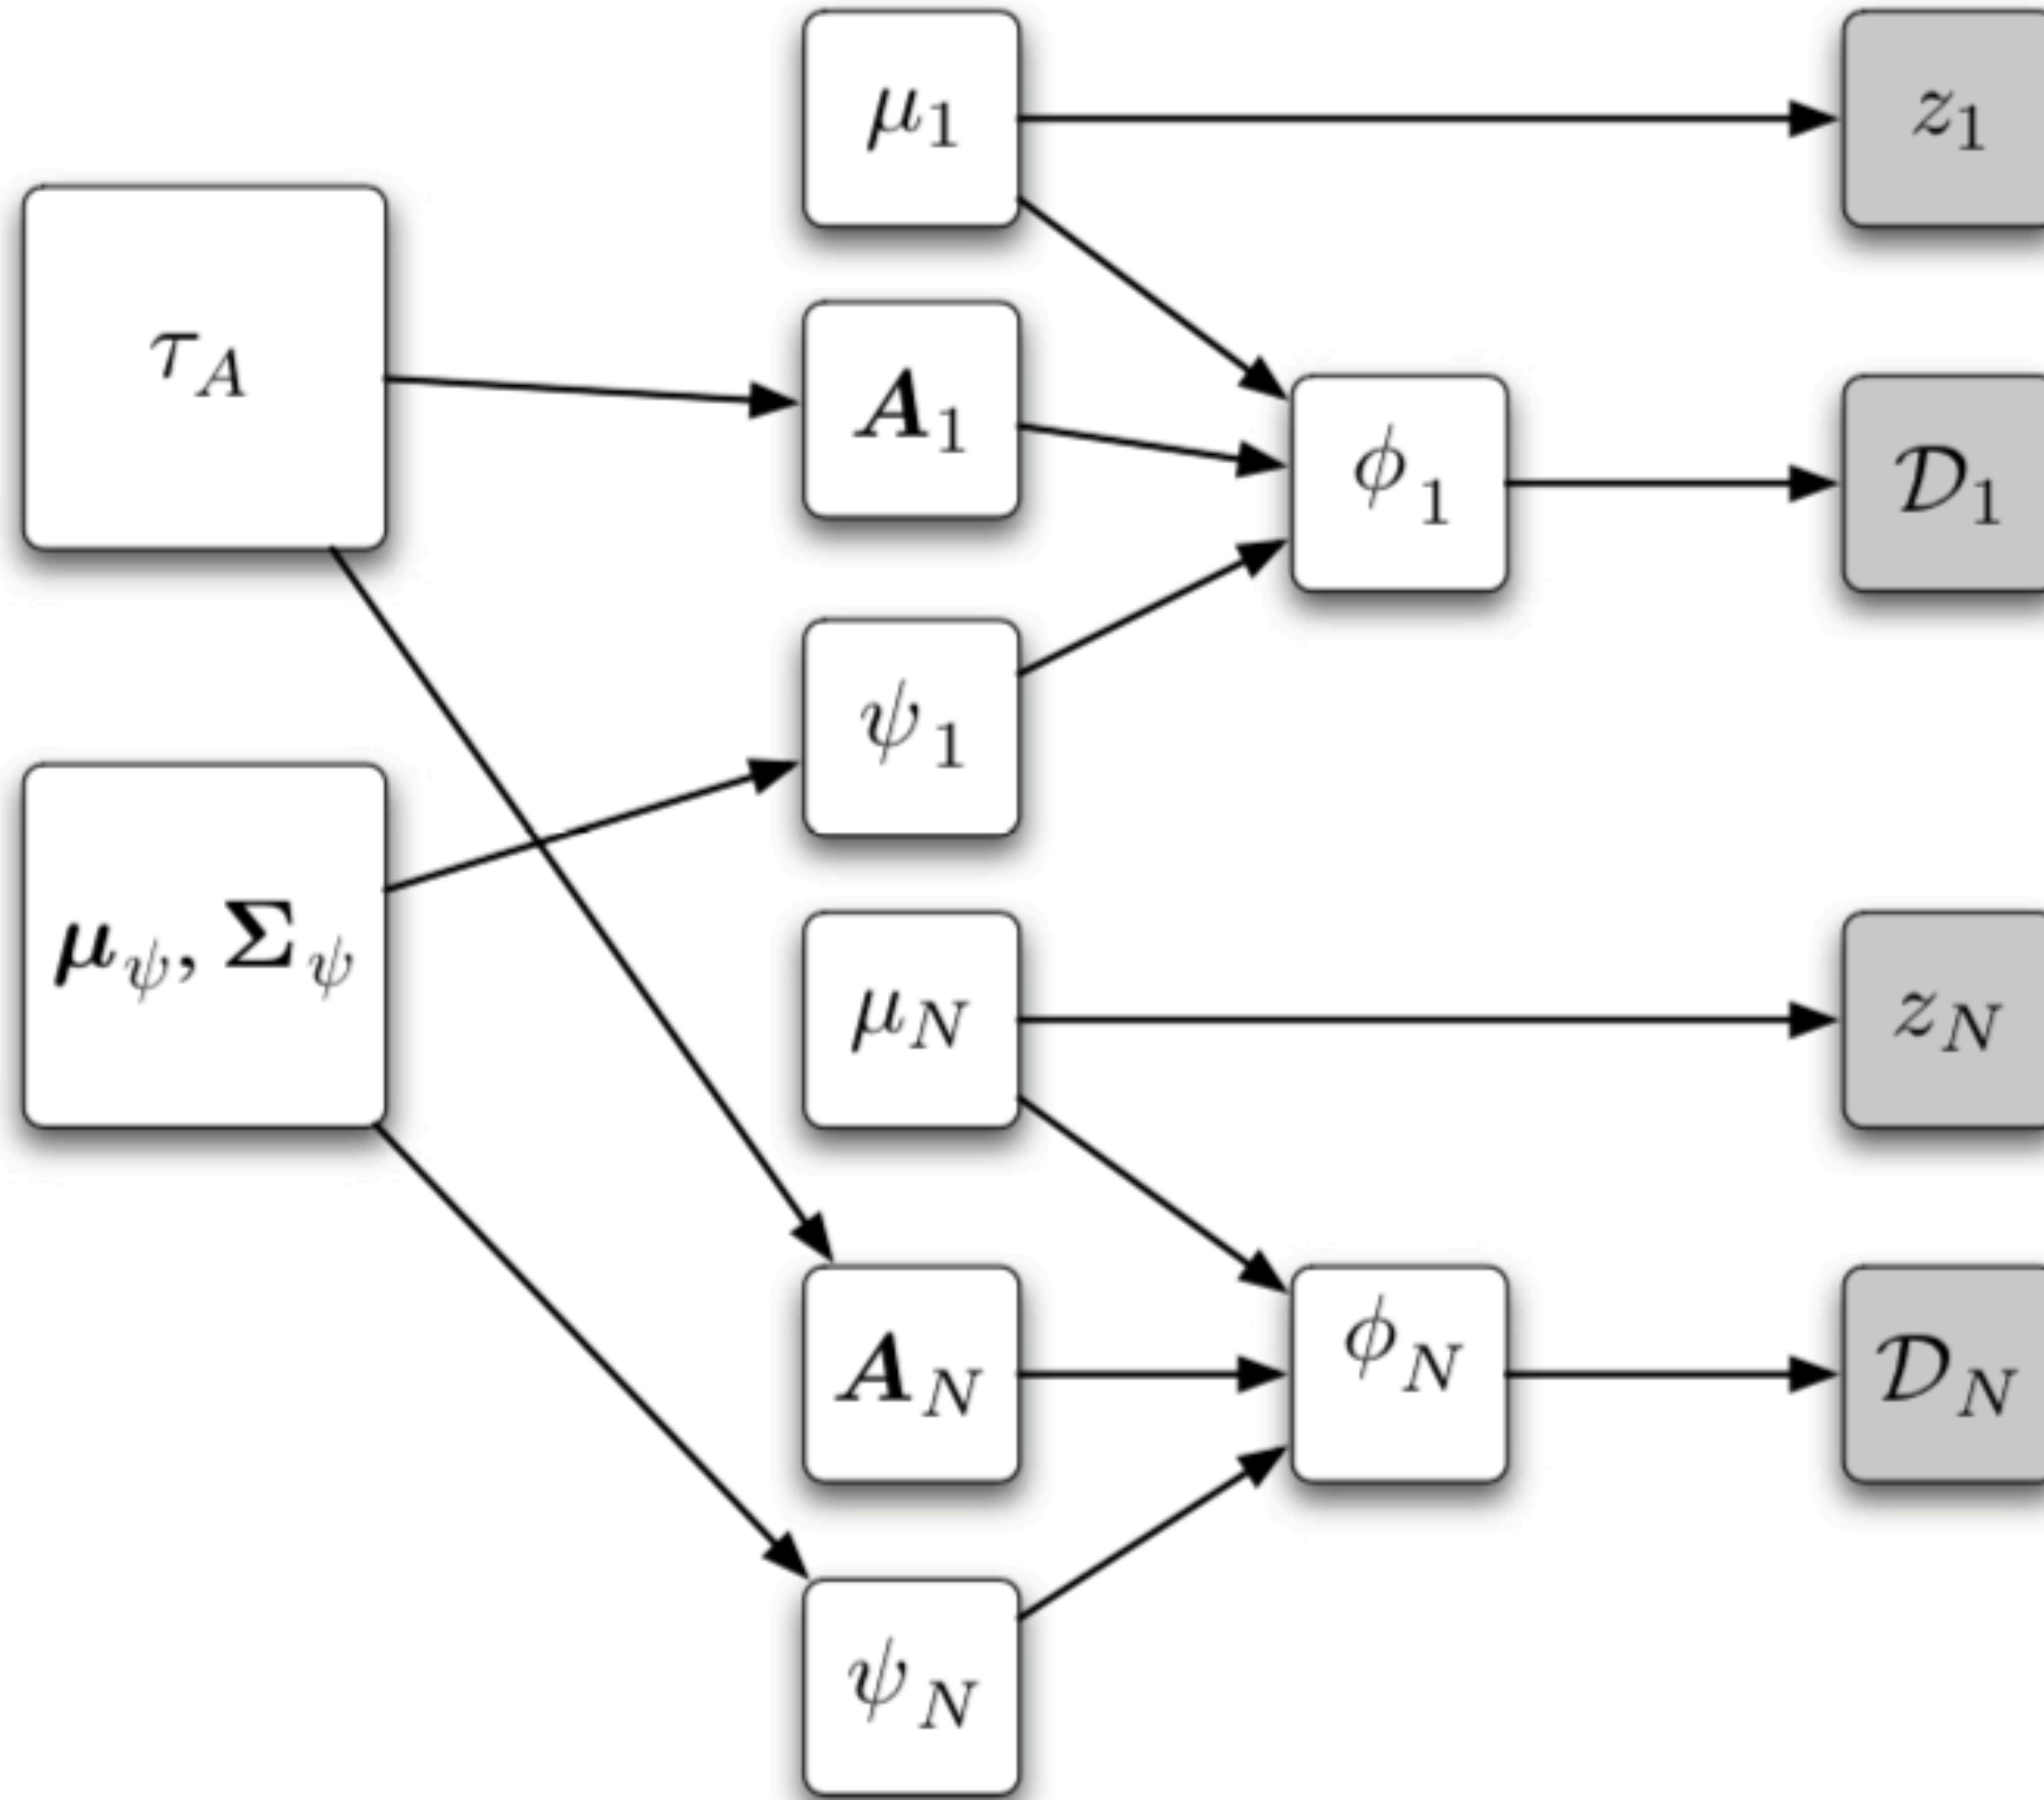

# SN Ia Light Curves

What observables and parameters do  
you have in SN Ia light curves?

supernova physics

dust extinction/reddening

How is this different?

$$p(\theta|D, I) \propto p(D|\theta, I)p(\theta|\alpha, I)$$

How is this different?

$$p(\theta|D, I) \propto p(D|\theta, I)p(\theta|\alpha, I)$$

↑  
assume to be known

How is this different?

$$p(\theta|D, I) \propto p(D|\theta, I)p(\theta|\alpha, I)$$

assume to be known

$$p(\theta, \alpha|D, I) \propto p(D|\theta, I)p(\theta|\alpha, I)p(\alpha|I)$$

How is this different?

$$p(\theta|D, I) \propto p(D|\theta, I)p(\theta|\alpha, I)$$

↑  
assume to be known

$$p(\theta, \alpha|D, I) \propto p(D|\theta, I)p(\theta|\alpha, I)p(\alpha|I)$$

↑  
infer  $\alpha$  along with  $\theta$

$$\begin{aligned} &P(\boldsymbol{\phi}_s, \mu_s, A_H^s, R_V^s \mid \mathcal{D}_s, z_s; \boldsymbol{\mu}_\psi, \boldsymbol{\Sigma}_\psi, \tau_A, \alpha_R) \\ &\propto P(\mathcal{D}_s \mid \boldsymbol{\phi}_s) \times P(\mu_s \mid z_s) \\ &\times P(\boldsymbol{\psi}_s = \boldsymbol{\phi}_s - \mathbf{v}\mu_s - \mathbf{A}_s \mid \boldsymbol{\mu}_\psi, \boldsymbol{\Sigma}_\psi) \\ &\times P(A_H^s, R_V^s \mid \tau_A, \alpha_R). \end{aligned} \tag{17}$$

# Could histogram individual parameters ...

---

... but how?

$$\begin{aligned} &P\left(\{\boldsymbol{\phi}_s, \mu_s, A_H^s, R_V^s\}; \boldsymbol{\mu}_\psi, \boldsymbol{\Sigma}_\psi, \tau_A, \alpha_R \mid \mathcal{D}, \mathcal{Z}\right) \\ &\propto \left[ \prod_{s=1}^{N_{\text{SN}}} P(\boldsymbol{\phi}_s, \mu_s, A_H^s, R_V^s \mid \mathcal{D}_s, z_s; \boldsymbol{\mu}_\psi, \boldsymbol{\Sigma}_\psi, \tau_A, \alpha_R) \right] \quad (18) \\ &\times P(\boldsymbol{\mu}_\psi, \boldsymbol{\Sigma}_\psi) \times P(\tau_A, \alpha_R). \end{aligned}$$

# Why?

---

- **Learn population parameters**
- **Improve inferences on individual population members**
- **self-consistent constraints on the physics**
- **can deal with large measurement uncertainties, systematic uncertainties and upper limits**
- **enables direct, probabilistic relationships between theory and observations**
